

3D Flux rope Model with Adjustable Twist

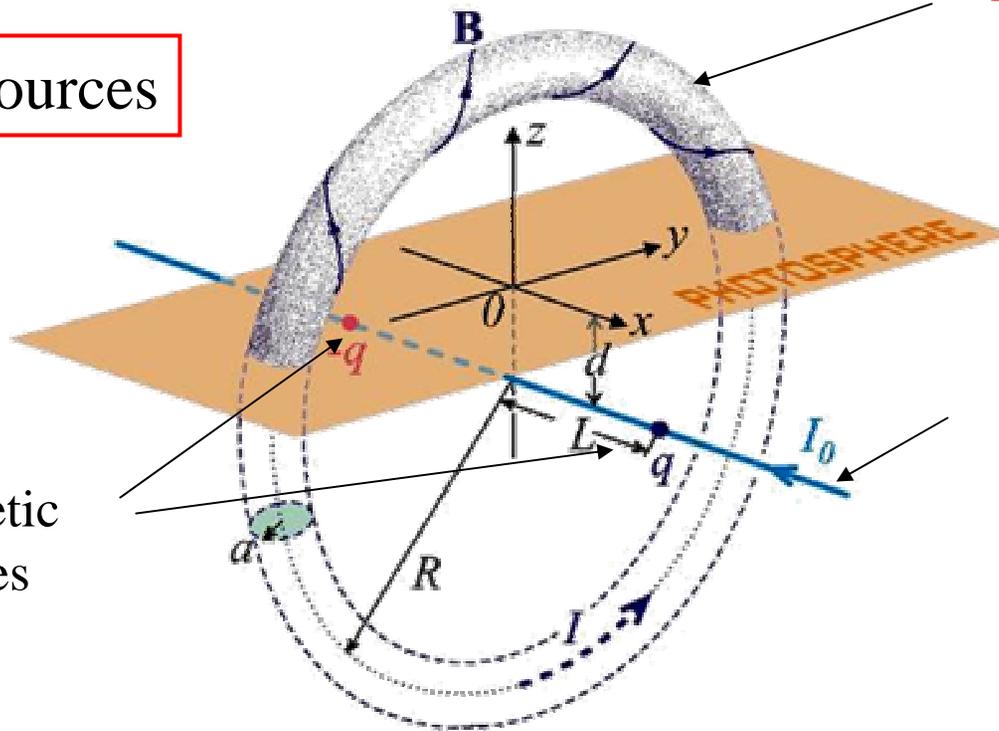

Titov & Démoulin (1999)

3 field sources

2. magnetic charges

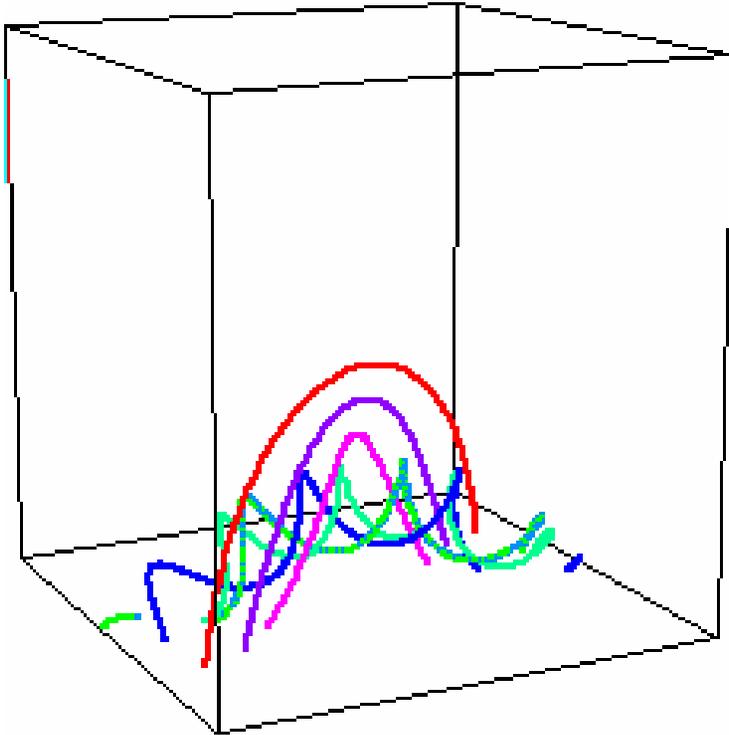

1. flux rope

3. line-current

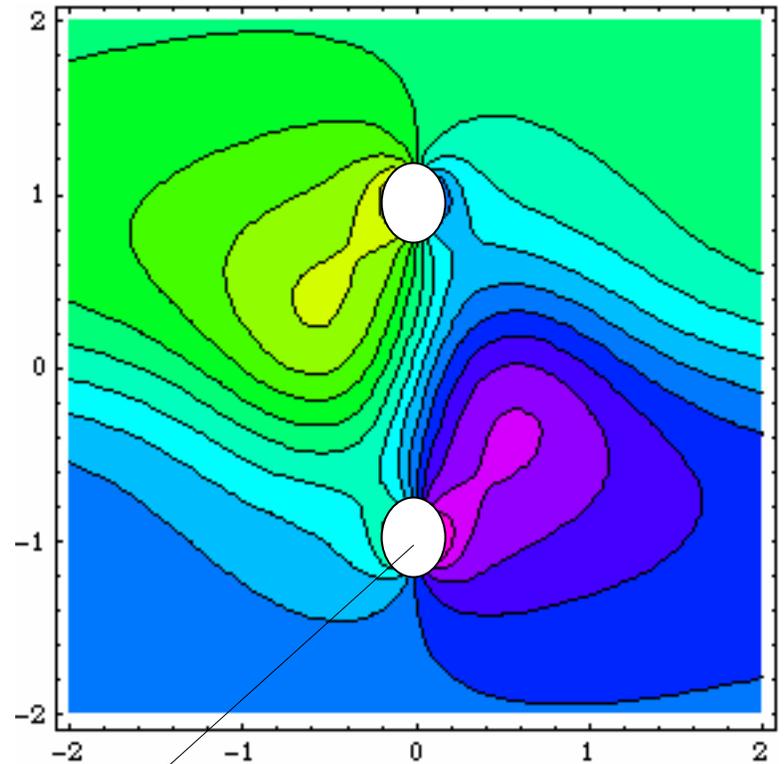

$$I_0 = I$$

Initial Configuration (Titov & Démoulin)

Normal Field at Surface

I : flux rope current

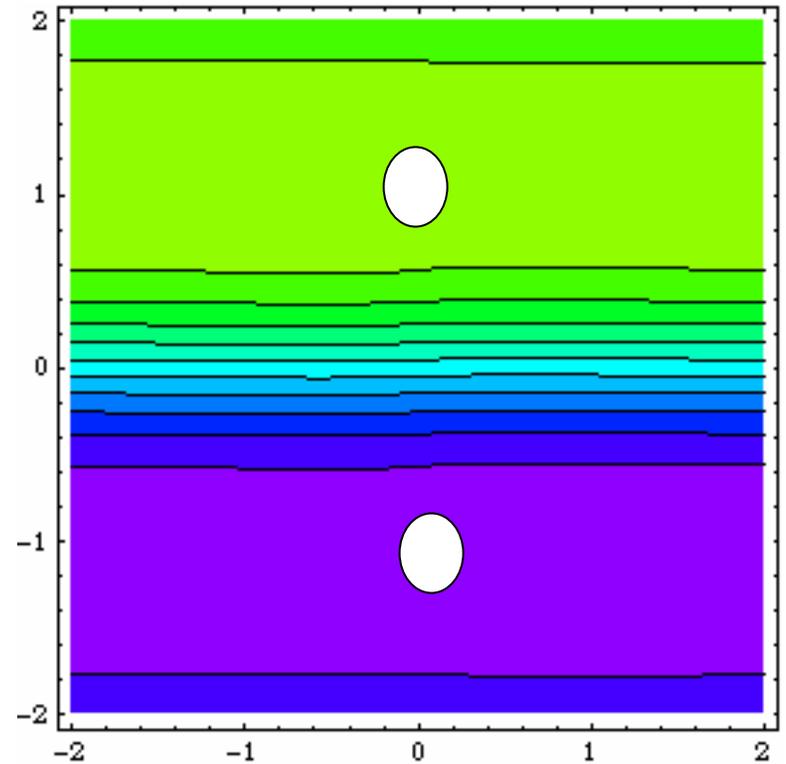

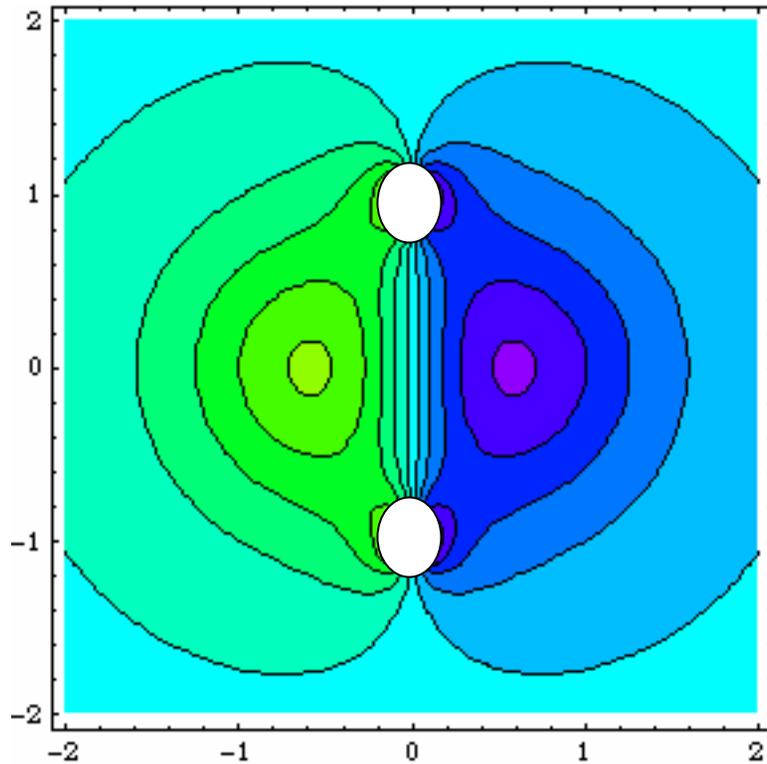

I_0 : sub-surface line current

flux-rope footprint

Extreme Limits of T&D Configuration

$$I_0 = 0$$

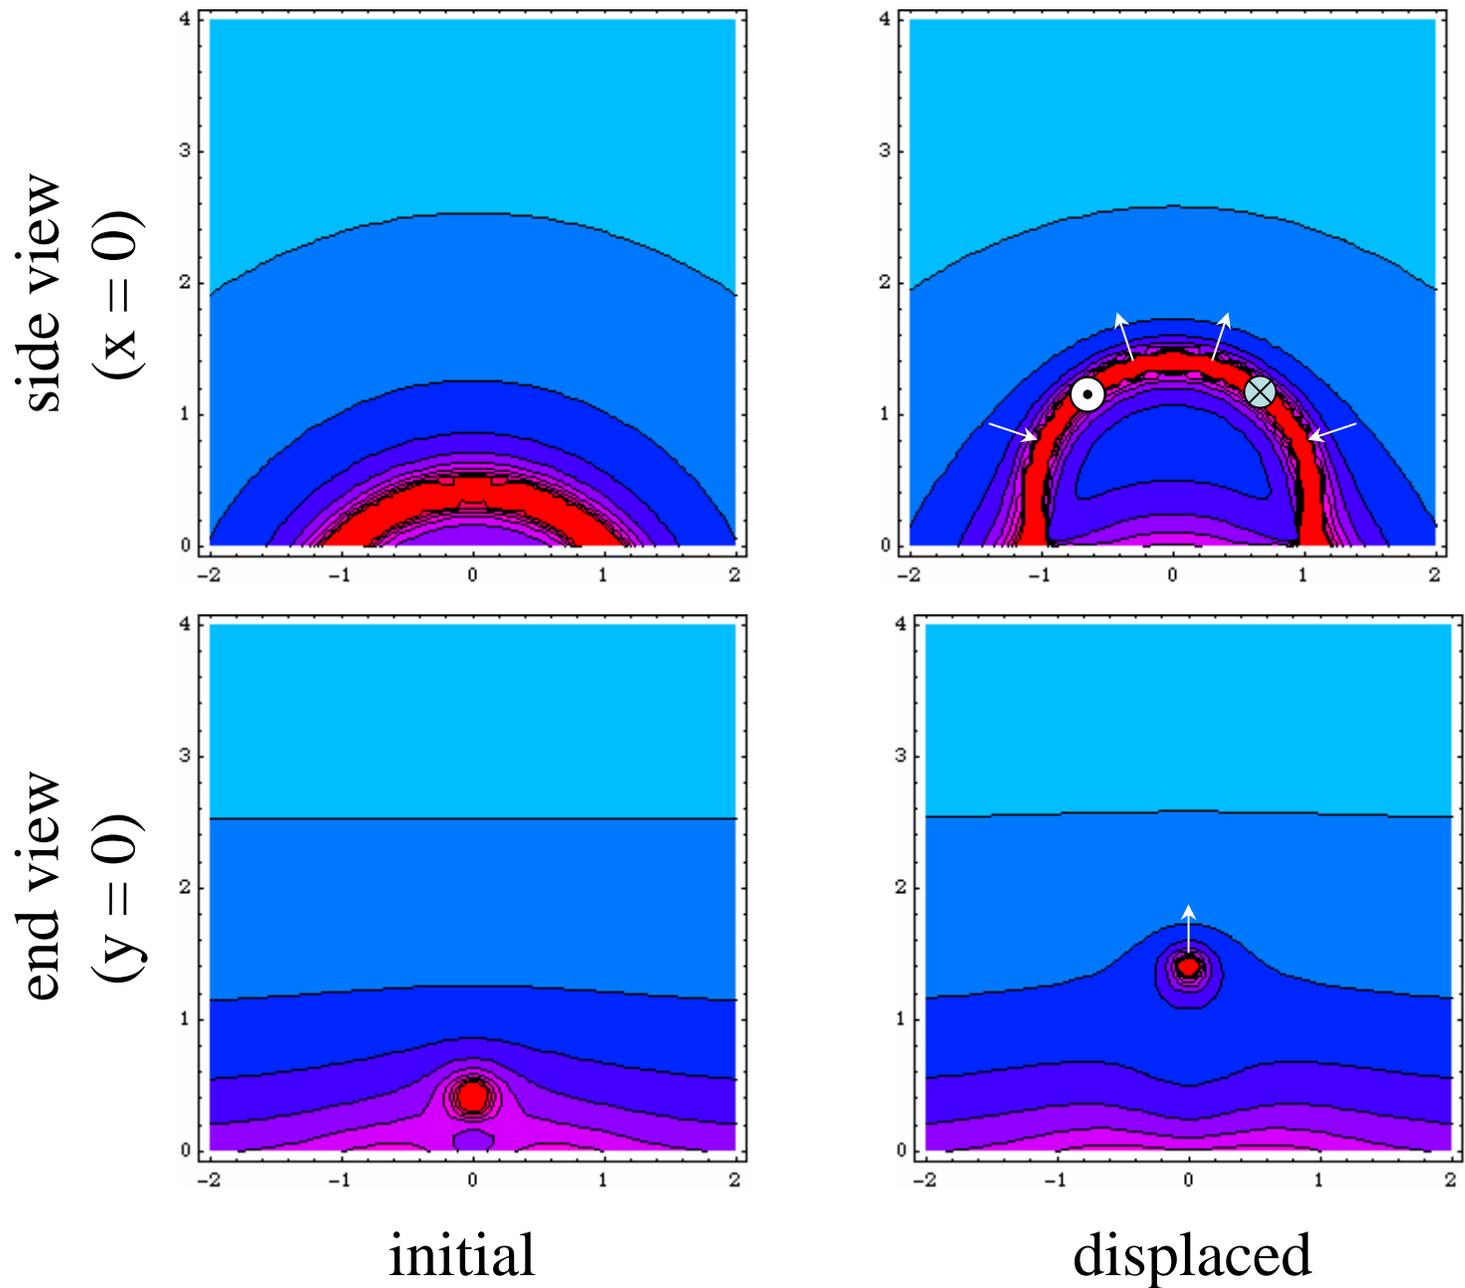

$$I_0 = 500 I$$

I : flux rope current

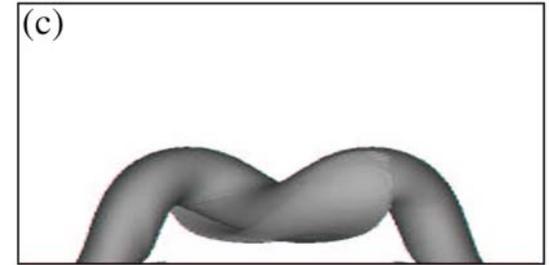

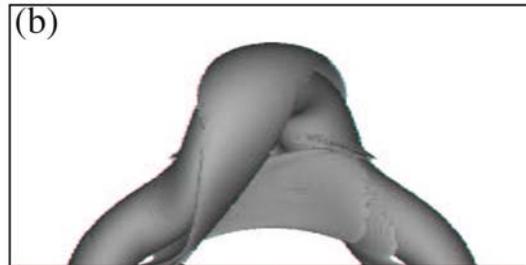

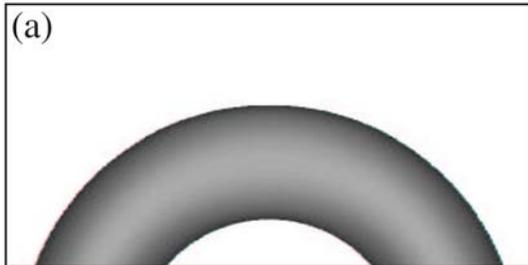

I_0 : sub-surface line current

Line-Tied Displacements

Principal Results of 3D Analysis

1. Eruption without escape
2. Out-of-plane twisting motion
3. Aneurism-like evolution
4. Existence of lower equilibrium

Confined Eruption

Kliem & Török (2004)

strong toroidal field everywhere
(large sub-surface line current)

QuickTime™ and a
YUV420 codec decompressor
are needed to see this picture.

“Failed Eruption” Observed by TRACE

QuickTime™ and a
Photo decompressor
are needed to see this picture.

Simulation of “Torus*” Instability

QuickTime™ and a
GIF decompressor
are needed to see this picture.

1. no subsurface line current
2. subcritical twist for helical kink
3. torus center near surface

*nonhelical kink
(see Bateman 1973)

QuickTime™ and a
BMP decompressor
are needed to see this picture.
